Mains supplies should be protected at all times. Effective mains protections can dramatically reduce systems downtime, as well as providing protection against lightning.

Internally the need for protection can be accommodated by safeguarding electronic equipment. Externally the structure can be protected by conventional methods. Our skilled engineers can design and install a tailor-made system in accordance with BS 6651 standards.

Subsequent to correct installation, protection is provided to the structure against the many damaging effects of an electrical storm.

With our comprehensive, unrivalled, experience throughout Ireland, Rainey can provide you with the necessary designing and installation

expertise to make your business or home safer against the devastating effects of lightning. Just call us and any member of our technical department will be pleased to offer advice and related costs. We also offer a preliminary survey and will

be pleased to call and discuss your requirements without obligation. Lightning protection is statutory on the continent and improved standards have been introduced to Ireland and Britain since 1990.

Lightning protection systems are designed to guard all types of buildings and existing installations are required to be checked annually by authorised and qualified personnel. Our Company provides this essential maintenance service and issues written certification on completion of testing to satisfy all insurance requirements.

Amongst the many buildings and public monuments we have protected are: Creameries, factories, hospitals, convents, banks, hotels, churches, chemical plants, public monuments, office buildings, computer centres, golf clubs, grand stands and department stores.

For further information please feel free to contact us at the address overleaf.
